

Using MongoDB w/Node

...

What we've all been waiting before

Base Project Setup

1. Create a Node project in WebStorm
 - a. New Project, select Node
 - b. Generates a project skeleton via express generator
2. Open the WebStorm terminal, type `npm install --save mongodb`

File by File Setup

Note

These slides should be used in conjunction with the example code at https://github.com/antauth/mongodb_node_example

/data

- Create this directory under the project root
- It will have our database modules

/data/mongo.js

- Create this file
- It will connect to our local database and provide us access to our bios collection

/routes/bios.js

- Create this file
- It will have our responses to HTTP requests made to the bios route
- It will also query our database for appropriate data

app.js

- Require and use our new bios route to respond to requests to /bios
- Initialize the connection to the database via the mongo module, which also needs to be required
